PROPOSAL DESCRIPTION (10 pts)

Motivation (1 pt)

(Describe the problem you want to solve and why it is important. Max 300 words).

The motivation of behind the developments of the online train ticket booking system is to understand real world railway reservation , ticket cancellation and waiting list with the implementation of C++ and DSA(data structure and algorithms) , this project of C++ and DSA topics of file handling , classes and objects , sorting , queue ,LinkedList , this project also help in understanding logical thinking , problem solving , and to design a computer application software , overall this project is help in connecting the practical knowledge with real life application creating a ticket booking software more efficient and organised .

This also help in developing the coding concepts of C++ and DSA (Data Structures and Algorithms) help in improving the errors.

State of the Art / Current solution (1 pt)

(Describe how the problem is solved today (if it is). Max 200 words).

Currently, online train ticket booking in India is mainly handled through platforms such as **IRCTC** and **IXIGO**, which provide services for train search, route and fare information, seat availability, ticket booking, and cancellation. We modernized the system by making booking easier for the user user can check the waiting list, available seats, best train available at best price for the passenger and cancel reservations view their booking details

While designing the system we use concepts of DSA in c and fundamentals of C++ concepts such as stack, queue, LinkedList etc, and in C++ we use concepts such as class, object, inheritance, polymorphism and concepts of array, dynamic memory allocation to manage train and passenger information respectively to organize and store important booking information.

Trough this project we learned the combine C++ and DSA programming skills to develop a practical application. It improves the problem solving, team work, research abilities and understanding on how data manage in real-life system.

Project Goals and Milestones (2 pts)

(Describe the project general goals. Include initial milestones as well any other milestones. Max 300 words).

Goals: The main goal of our project of online train ticket booking is help us to develop the understanding the concepts of C++ and data structure algorithms and develop a software for develop a simple efficient and user-friendly railway reservation platform. The system is made for train searching, train booking, easier and less dependency on other platforms for train booking.

Milestone: system designing of overall structure, modules, menu and data applications use of array, stack, queue, LinkedList use of class, objects, inheritance and file handling develop the functionality train and check availability seats add ticket cancellation and seat update functionality, combinations of different modules in one system, prepare and demonstration of projects

Project Approach (3 pts)

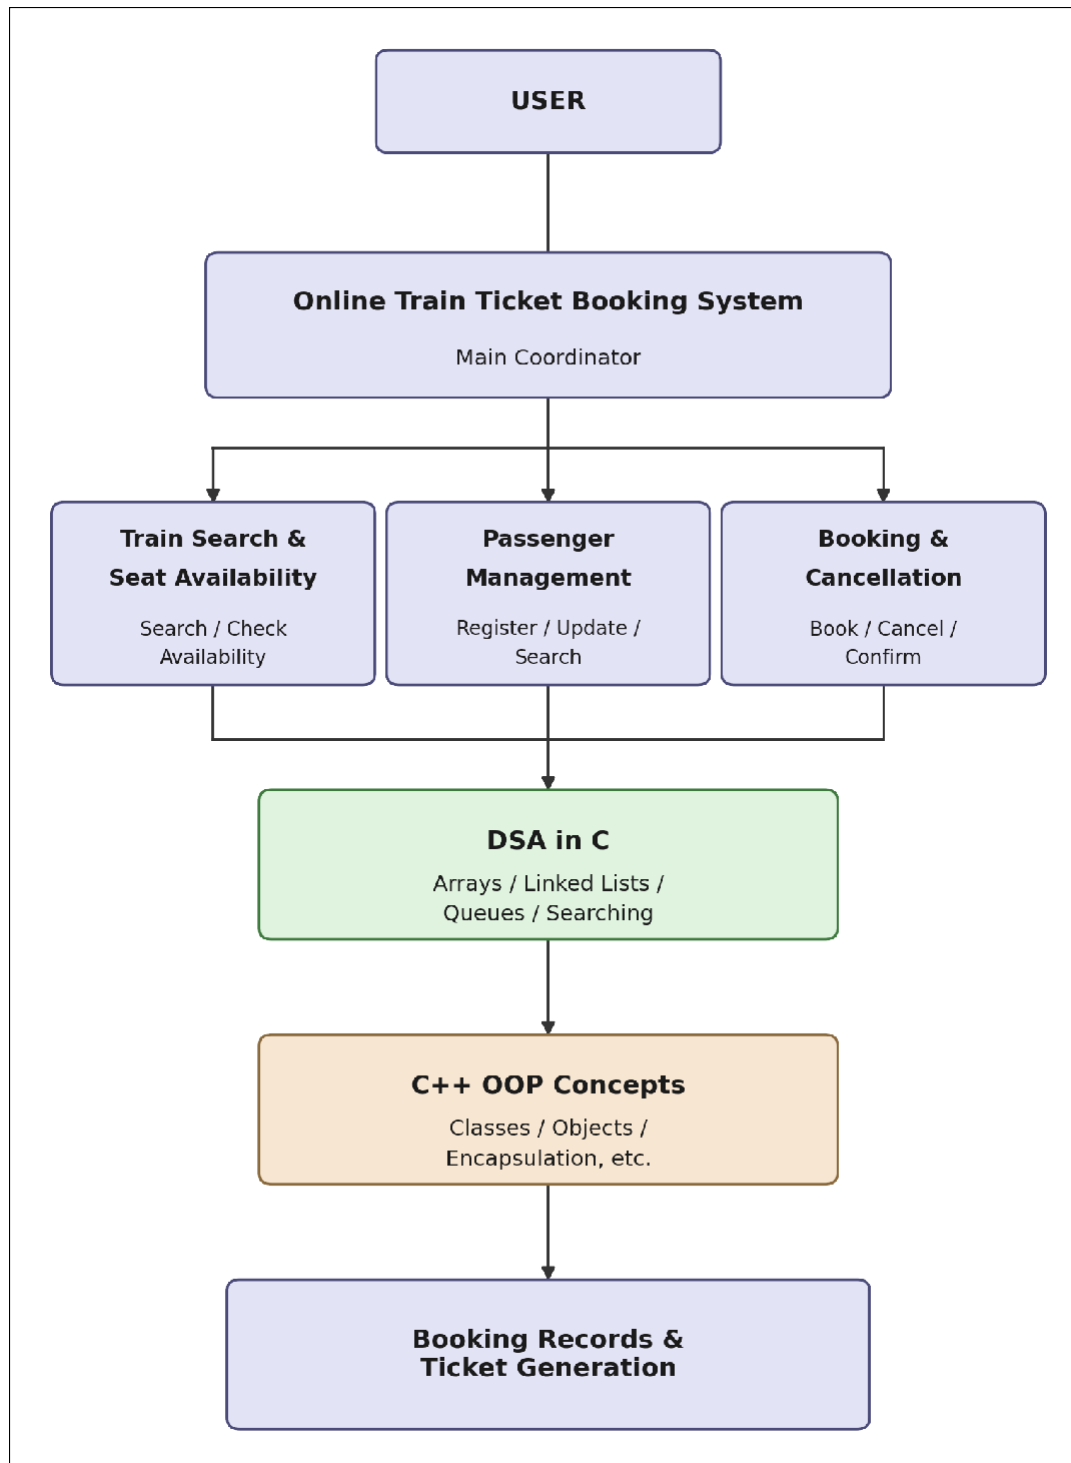

(Describe how you plan to articulate and design a solution. Including platforms and technologies that you will use. Max

- **The online train ticket booking system will be developing using C++ and data structures and algorithm (DSA) the project help to make a menu driven application**
- **Use of suitable DSA concepts such as arrays, structure, queues, stacks, searching and sorting.**
- **Develop the individual modules for train management, passenger management, booking and cancellation.**
- **Use of class, objects and inheritance and file handling to develop a system.**
- **Check the system correctness and proper implementation of C++ and DSA**
- **And check final working model.**

300 words).

System Architecture (High Level Diagram)(2 pts)

(Provide an overview of the system, identifying its main components and interfaces in the form of a diagram using a tool of your choice).

Project Outcome / Deliverables (1 pts)

(Describe what are the outcomes / deliverables of the project. Max 200 words).

The main outcome of the project is to develop a train ticket booking system using C++ and Data structures and algorithms the system will provide an organised a platform to search train, book a seat, views on waiting list, availability, schedule of train, cancel reservation and booking details.

The project demonstrates the practical application of DSA concepts such as array, stack, queue, circular queue, LinkedList, C++ concepts such as class, objects, inheritance, encapsulation and file handling will also be applied.

The following modules applied

- Train search and availability module
- Passenger registration module
- User and admin module
- Booking history and ticket details
- Menu driven programme
- Application of DSA and concepts of efficient data management
- Functions of C++ used in projects.

Assumptions:

The assumptions of projects while developing online ticket booking system:

1. The system is designed for educational and project purpose and does not perform real time railway reservations.
2. User are assumed to provide correct and valid passenger information while booking ticket.
3. Every person has a user booking ID.
4. ID should be unique.
5. Train details such as train number, timing, seat capacity in a predefined system.
6. The system should have menu driven applications.
7. Data should be stored properly.
8. The system should have a real time railway reservation.

Reference:

(Provide a list of resources or references you utilised for the completion of this deliverable. You may provide links).

Object Oriented Programming in C++ – Concepts such as classes, objects, inheritance, polymorphism, and encapsulation.

- IRCTC – government website for booking train ticket
- W3schools – for basics and fundamentals of c++
- Tutorial points – concepts of object oriented programming
- Geeks for geeks – for the knowledge of array , stack , queue , linkedlist and advance concepts of DSA
- Fundamentals of c – by Dennis Ritchie.
